Antennas are metallic structures designed for radiating and receiving electromagnetic energy. An antenna acts as a transitional structure between the guiding device (e.g. waveguide, transmission line) and the free space.

Wave propagation operates

- Transmitting and receiving antennas must be within line of sight
- o Satellite communication – signal above 30 MHz not reflected by ionosphere
- o Ground communication – antennas within effective line of sight due to refraction
- Refraction – bending of microwaves by the atmosphere

wave propagation, including ground wave and ionospheric propagation, goes on to make this text a useful and self-contained reference on antennas and radio wave propagation. While a rigorous analysis of an antenna is highly mathematical, often a simplified analysis is sufficient for understanding the basic principles of operation of an antenna.
