The Physical Origins of Partial Differential Equations. The initial condition is $u(x,0) = 0$ and the boundary condition is $u(0,t) = n_0$. To solvethe equation goto characteristiccoordinates $\xi = x - ct$ and $\tau = t$. Then the PDE for $N = N(\xi, \tau)$ is $N_\tau = -r \sqrt{N}$. Separate variables and integrate to get $2 \sqrt{N} = -r\tau + \Phi(\xi)$.

Thus the solution of the partial differential equation is $u(x,y)=f(y+ \cos x)$. To verify the solution, we use the chain rule and get $u_x = -\sin x f_0(y+ \cos x)$ and $u_y = f_0(y+\cos x)$. Thus $u_x + \sin x u_y = 0$, as desired.

Applied Partial Differential Equations - J. R. Ockendon ...

In mathematics, a partial differential equation(PDE) is an equation which imposes relations between the various partial derivativesof a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 - 3x + 2 = 0$.
