The high-pressure pump CP4 delivers the fuel into the connected rail under high pressure. The CP4 consists of one or two high-pressure elements, each integrated in a housing with its own camshaft. The pump camshaft is driven by belts, chains, or cogwheels and moves the pump pistons to generate the required high pressure.

High-pressure pump CP4/CP4N - Bosch Mobility Solutions

While other diesel injection systems generate the fuel pressure for each injection separately, the Common Rail System separates pressure generation and injection from one another. The fuel is constantly available at the pressure required for injection. The Common Rail System is modular in design. The right combination of high-pressure pump, injectors, rail and electronic control unit results in systems for all types of engine.

High-pressure rail for common-rail systems for precise fuel injection and reduced emissions The high-pressure rail gives its name to the common-rail system and binds the pump and injectors together as the central hydraulic component. It stores the compressed fuel and supplies this to the injectors.

High-pressure rail for common-rail systems

This approach was used in some early Bosch common rail fuel systems employing the CP1 pump. A solenoid actuated pin would hold the suction valve to one of the pumping elements open during the entire pumping cycle at engine operating conditions such as idle and low load/low speed. The pump in Figure 2 illustrates one such element cut-off valve.
