Charge And Circuit Review Guide

Charge is supplied with energy in the internal circuit and the energy is transformed into other forms in the external circuit. Charge is consumed as it moves through the energy-transforming devices of the external circuit. For instance, the amount of charge entering a light bulb in a second is less than that which exits the light bulb in a second. A battery is used to power a flashlight circuit.

Allow the charging to continue for up to 20 minutes if the charger makes clicking noises. The clicking can be the circuit breaker cycling and can indicate a defective battery, or a very discharged battery that isn't defective. If the clicking doesn't stop after about 20 minutes, the battery may well be bad and you should replace it.

Electricity/Magnetism Study Guide (Answer Key)

- Because it takes work to move a charge in a field, charge possesses electrical potential energy when in a field
- Voltage is the electrical potential energy per unit charge and is always measured as the difference in potential energy between two points - if a second point is not explicitly stated, one has been assumed (e.g., ground)

Physics Simulations: Charging

Check on fast charge capability: Although many NiMH cells can be fast charged it is not appropriate for all. Check on the datasheet before applying a fast charge.

Fast charging: If the NiMH cells can be fast charged, then they are best charged in this mode. It is easier to detect the end of charge point when charged in this way.
