CT Scan uses harmful x-rays (the form of electromagnetic radiation like light) for imaging, while MRI does not use any radiation and is based on the effect of the magnetic field, radio waves for the imaging of the organs of the body. CT Scan gives the images of the bones in a much-sophisticated way than the x-ray and is good to check the fractures, tumors, and arthritis but MRI which is popular in detecting the damage of soft tissue.

Difference Between CT Scan (Computed Tomography) and MRI ...

In a single scan, body CT can evaluate bone, soft tissue, and blood vessels. Unlike MRI, if you have metal in your body (shrapnel, bullets, needles, etc.) or an implanted medical device, you can still have a body CT since no magnets are used in the procedure.

Body CT - ARA Diagnostic Imaging

CT scans and MRIs are both used to capture images within your body. The biggest difference is that MRIs (magnetic resonance imaging) use radio waves and CT (computed tomography) scans use X-rays...

CT Scans vs. MRIs: Differences, Benefits, and Risks

MRI may give different information than a CT scan about certain conditions. To learn more, see the topic Magnetic Resonance Imaging (MRI) . A low-dose CT is a way to scan the lungs more quickly than with a standard CT. Some doctors recommend this to screen for lung cancer in people who are older than 55 and who are at high risk for lung cancer.
