Dynamic models are essential for understanding the system dynamics in open-loop (manual mode) or for closed-loop (automatic) control. These models are either derived from data (empirical) or from more fundamental relationships (first principles, physics-based) that rely on knowledge of the process. A combination of the two approaches is often used in practice where the form of the equations are developed from fundamental balance equations and unknown or uncertain parameters are adjusted to ...

Dynamic Modeling for Control of the Milling Process ...

Dynamic kill modeling is the core analysis that drives every aspect of regaining hydrostatic control of a blowout, when other surface control may not be available. Dynamic kill simulations are used to evaluate the requirements necessary to kill a well where the back-pressure cannot be controlled, or control is limited.

Well Control Modeling

The quandary of an engineer who must develop a dynamic physicochemical or biological model to use in process control is that a very large range of possible models can be used, from simple to complex.
