Tags in Git can be used to add a version number: git tag -a "v1.5.0-beta" -m "version v1.5.0-beta" adds a version tag of v1.5.0-beta to your current Git repository. Every new commit after this will auto-increment tag by appending commit number and commit hash. This can be viewed using the git describe command.

How to manage the version number in Git? - Stack Overflow

the software configuration management is now taken by Git. Currently Jenkins2 is the most widely adopted continuous integration coordinator for pipelines. We will use IBM Dependency Based Build which enables you to implement mainframe build automation with Git and Jenkins for traditional mainframe artifacts.

If you're using a ticketing system, you should also include the ticket id in the description. A number of modern VCS hosting systems, like GitHub, auto-link the commits to the issues. 3. Commit early, commit often

Best practices for using Git - DeepSource

Tagging practices. As you already know, Git gives you commit identifiers like 1.0-2-g1ab3183 but those are not tags! Tagging is done with git tag, and the tags that are created using git tag are the base for the commit identifiers git describe creates. In another words, in Git you don't tag branches. You are tagging commits.
