Internet QoS: Architectures and Mechanisms for Quality of ...

Quality of service (QoS) is the description or measurement of the overall performance of a service, such as a telephony or computer network or a cloud computing service, particularly the performance seen by the users of the network. To quantitatively measure quality of service, several related aspects of the network service are often considered, such as packet loss, bit rate, throughput ...

Quality of service - Wikipedia

It is the default QoS model used for Internet and it doesn't implement any QoS mechanism at all, that is the reason why there isn't any complexity associated to this QoS model. BE does not allow for resource reservation or any other mechanism related to asking for some kind of special treatment to the network.

QoS architecture models: IntServ vs DiffServ

QoS Architectures There are three types of QoS, namely, perceived, assessed, and intrinsic QoS. Perceived QoS (P-QoS) is a user-oriented QoS defined as the quality perceived by the users which depends on what the end points can do for the applications. It is mainly concerned with the software application industry not the network industry.
