That is, the solutions of $Ax = 0$ are the vectors of the form $x = Nz$. In other words, the columns of N span the null space of A . One can also use the technique to solve inhomogeneous equations $Ax = b$. One simply applies the theory to the augmented matrix $[A \ b]$. There is a solution when the last column of A is not a pivot column. A particular

solution. Solution: Let $f(x, y) = p \sqrt{1 - y^2}$. Then $\partial f / \partial y = -2 y p \sqrt{1 - y^2}$. These functions are well-defined and are continuous as long as $y^2 < 1$, that is, for $-1 < y < 1$.
