Light (also referred to in professional literature as radiation) is best thought of as a spectrum consisting of ultraviolet light (UV) at the short end, visible light in the center, and infrared (IR) wavelengths at the long end. UV light is measured in microwatts of ultraviolet radiation per lumen of visible light ( $\mu\text{W/l}$ ).

### **Ir | Definition of Ir by Merriam-Webster**

Infrared spectroscopy is the measurement of the interaction of infrared radiation with matter by absorption, emission, or reflection. It is used to study and identify chemical substances or functional groups in solid, liquid, or gaseous forms. The method or technique of infrared spectroscopy is conducted with an instrument called an infrared spectrometer which produces an infrared spectrum. An IR spectrum can be visualized in a graph of infrared light absorbance on the vertical axis vs. frequenc

### **IR - Definition by AcronymFinder**

The infrared (IR) sensor on the satellite detects electromagnetic radiation in the “thermal IR”, at wavelengths between 10 and 12 micrometers (about 20 times longer than the wavelength of visible light). The intensity of the IR radiation reaching the satellite depends on the warmth of the object emitting that radiation.

Infrared (IR) is a wireless mobile technology used for device communication over short ranges. IR communication has major limitations because it requires line-of-sight, has a short transmission range and is unable to penetrate walls. IR transceivers are quite cheap and serve as short-range communication solutions.
