choose to use Frame Relay on some internal part of their own network. The ISDN service you get from the phone company might at some point run on top of (or through) a Frame Relay network. In this same way, SMDS can carry Frame Relay, or ATM, or X.25, or ISDN. ISDN can carry X.25. SONET can carry Frame Relay. And so on, and so on.

ISDN - A Tutorial

The main device in the narrowband ISDN is the frame relay. The second generation of ISDN is referred to as the broadband ISDN (B-ISDN). It supports very high data rates (typically hundreds of Mbps). It has a packet switching

ISDN - What is the ISDN? - Computer Notes

Broadband Integrated Service Digital Network (B-ISDN) is a standard for transmitting voice data and video at the same time over fiber optic telephone lines. Boadband ISDN can support data rates up to 2 Mbps which is an improvement on the original ISDN bandwidth rate of 64Kbps or 128Kbps when using both connections. The B-ISDN was envisaged to run over ATM carrying both the synchronous voice and the asynchronous data on the same transport bearer.
