Module Design Pattern JavaScript modules are the most prevalently used design patterns for keeping particular pieces of code independent of other components. This provides loose coupling to support well-structured code. For those that are familiar with object-oriented languages, modules are JavaScript "classes".

Earlier, we went through how to define data types in JavaScript through functions and adding methods to the object's prototype. The Prototype pattern allows objects to inherit from other objects, via their prototypes. The prototype pattern is a pattern where objects are created based on a template of an existing object through cloning.

In JavaScript, regular expressions are also objects. These patterns are used with the `exec ()` and `test ()` methods of `RegExp`, and with the `match ()`, `matchAll ()`, `replace ()`, `search ()`, and `split ()` methods of `String`. This chapter describes JavaScript regular expressions. Creating a regular expression

Unlike other programming languages, JavaScript doesn't have access modifiers, that is, you can't declare a variable as private or public. So the Module pattern is also used to emulate the concept of encapsulation. This pattern uses IIFE (immediately-invoked function expression), closures and function scope to simulate this concept.
