Manual Solution Differential With Numerical

The solution is found to be $u(x)=|\sec(x+2)|$ where $\sec(x)=1/\cos(x)$. But sec becomes infinite at $\pm\pi/2$ so the solution is not valid in the points $x = -\pi/2 - 2\pi n$ and $x = \pi/2 - 2\pi n$. Note that the domain of the differential equation is not included in the Maple dsolve command. The result is a function that solves the differential equation for some x-values. It is up to

text, we consider numerical methods for solving ordinary differential equations, that is, those differential equations that have only one independent variable. The differential equations we consider in most of the book are of the form $Y'(t) = f(t, Y(t))$, where $Y(t)$ is an unknown function that is being sought. The given function $f(t, y)$

NUMERICAL SOLUTION OF ORDINARY DIFFERENTIAL EQUATIONS

Numerical Methods for Differential Equations. It is not always possible to obtain the closed-form solution of a differential equation. In this section we introduce numerical methods for solving differential equations. First we treat first-order equations, and in the next section we show how to extend the techniques to higher-order equations.
