Today almost all new marine engines use the closed cooling system design. These systems are pressurized, just like your car or truck. By increasing the pressure inside the closed part of the system, the boiling point of the coolant is enhanced.

Most newer marine engines use an enclosed cooling system. This means that there is a small tank on the top of the engine that uses a combination of fresh water and coolant. This fresh water is circulated through the engine and through a heat exchanger. The fresh water, in this system, absorbs the heat

Cooling Systems; Raw(Sea) water cooling systems draw water outside the boat (seawater or lake water). Water is pumped from the source to engine block then the engine circulation pump forces the raw water go through the engine block and expelled through exhaust manifold. Raw water cooling systems are relatively ...

There are two main ways engine manufacturers engineer the cooling system on a boat: 1. Raw Water Cooling System This style sucks the salt-water straight out of the ocean, through a strainer (filter), and then cycles it through your engine block.

After passing through the engine, where it removes the heat from the cylinder liners, cylinder heads, exhaust valves and sometimes the turbochargers, it is cooled by seawater and then returns to the engine. The temperature of the cooling water is closely controlled using a three way control valve.
