Motor-skill acquisition has long been defined in the scientific community as an energy-intensive form of stimulus-response (S-R) learning that results in robust neuronal modifications. In 1898, Thorndike proposed the law of effect, which states that the association between some action (R) and some environmental condition (S) is enhanced when the action is followed by a satisfying outcome (O).

Acquiring motor skill is a process that requires practices, feedback, and involvement of the learner. This frame of reference employs several principles from learning theory. It focuses on the child's ability, characteristics of the task, skills required, environment, and regulatory conditions. Regulatory conditions are aspects of the environment that determine movement specifics, which are described in a continuum between closed and open tasks.

To this end, Fitts (1964; Fitts & Posner, 1967) suggests that motor skill acquisition follows three stages: the cognitive stage, the associative stage, and the autonomous stage. As a coach I found this simple paradigm to be extremely helpful for understanding, guiding, and accelerating the motor learning process.

Motor skill acquisition is a process in which a performer learns to control and integrate posture, locomotion, and muscle activations that allow the individual to engage in a variety of motor behaviors that are constrained by a range of task requirements (e.g. athletic context) (Newell, 1991).

Psychology. This paper reviews the psychological and motor performance modeling literature to identify important factors involved in and affecting the modeling process as it relates to motor skill acquisition. Topics discussed include modeling theory, task specificity of modeling effects, the importance of symbolic coding, temporal spacing of demonstrations, social factors influencing modeling, and the role of modeling in reducing anxiety when unfamiliar motor activities are learned.
