Abstract. The problem of nonlinear programming is that of maximizing (or minimizing) a given function subject to a set of inequality constraints. Such problems arise in many areas of economics, such as the micro economic theory of the household and the firm. It has also had wide applicability in game theory and operations research.

A nonlinear programming formulation is introduced to solve infinite horizon dynamic programming problems. This extends the linear approach to dynamic programming by using ideas from approximation theory to avoid inefficient discretization. Our numerical results show that this nonlinear programming method is efficient and accurate. Yongyang Cai
