Perfect optics through light scattering. Innovative technologies are the key to tackling some of society's key challenges - and many of these technologies have an optical system at their core. Examples include semiconductor lithography systems designed to create ever-smaller and more energy-efficient microchips, satellite-based high-resolution earth observation systems, and basic research in the field of gravita-tional-wave detection.

Perfect optics through light scattering

Optics of light scattering media : problems and solutions ...

However, elastic optical scattering is deterministic and time-reversible, and propagation of light through a scattering medium can be described by a scattering matrix. In principle, if the propagation behaviour was understood, it would be possible to reconstruct an image of the object as if the scattering media was absent.

Methods of Imaging through Scattering Media

Scattering is a major cause of propagation losses in optical components. It has already been mentioned above that scattering limits the propagation losses which are achievable in optical glass fibers. Scattering is also a fundamental challenge for the use of ceramic media as optical materials.

The derived laws apply to layers whose scattering coefficient S and absorption coefficient K vary vertically to the surface of the layer. In the general case the differential equations of the preceding paper [P. Kubelka , J. Opt. Soc. Am.38, 448 (1948)] must be used; the coefficients, however,

hitherto constant, now are functions of the distance x from the surface. In the practically ...

Rayleigh scattering: For glass fibers the foremost type of scattering is Rayleigh scattering. With this process, atoms or other particles within the fiber absorb the light signal and instantly re-emits the light in another direction.

Scattering losses in optical fiber.

Rayleigh scattering is a process in which electromagnetic radiation (including light) is scattered by a small spherical volume of variant refractive indexes, such as a particle, bubble, droplet, or even a density fluctuation. This effect was first modeled successfully by Lord Rayleigh, from whom it gets its name.

The topic is very broad and incorporates such diverse areas as atmospheric optics, ocean optics, optics of close-packed media, radiative transfer, light scattering, absorption, and scattering by single scatterers as well as by systems of particles, biomedical optics, optical properties of cosmic dust, remote sensing of atmosphere and ocean, etc.

The changes in refractive index modulate the optical path length (OPL) of light, causing phase variations. In addition, in scattering media, ultrasound induces particle displacement, which modulates the physical path length, and thereby, the phase of the light.

Scattering Media. The purpose of this application is to use phase modulated light to see an object clearly through a surrounding turbid media. The photoelastic modulator is used to detect, nearly instantaneously, the difference in scattering of two orthogonal states of linear or circular polarization.

Scattering Media - Hinds Instruments

Experimental investigations have been undertaken of some aspects of the propagation of helium-neon gas laser radiation at $\lambda = 0.63 \mu$ for different scattering media (artificial water fogs, wood smokes, model media). It has been shown that the attenuation coefficients practically coincide when coherent and incoherent radiation is scattered.
