The Sheet Metal Rolling Machine works according to the principle of three point bending. The rotation of the driven rolls being utilized to feed the metal through the rolls by means of the frictional forces present between the surface of the rolls and sheet.

This machine works on simple kinematic system instead of complicated design. This machine can bend up-to 4-5mm thickness of sheet. Due to its portability it can be used by small workshop or fabrication shop. It is widely used in various industrial operations such as bending a sheet in required shape & size.

Influence of material on plate rolling. One of the most important factors in the design of the plate rolling machine is the material of the metal. For example, rolling a metal plate of the same thickness, the plate with a high yield strength must have a high pressure on the roll bending machine. If not considered, the processed material will be deformed at corners or some other defects occurs.

Introduction. Since the load on the plate roll bending machine is large, so the requirement for the parts strength is high. In addition, due to the fierce competition in the market, it is urgent to reduce the cost of the plate rolls, so it is imperative to design the machine accurately and reliably. For the design calculation of the roll bending machine, the force analysis of the rolling machine is required first, and the result is the original parameters of the design of each part of the ...

There are different kinds of technology to roll the metal plate: Four-roller machines have a top roll, the pinching roll, and two side rolls. The flat metal plate is placed in the machine on either side and "pre-bent" on the same side. The side rolls do the work of bending. The pinching roll holds the plate.
