Testing Strategy. For a reliability test to bogy, one needs to define the sample size, which is a function of the minimum reliability and confidence to be demonstrated. For a minimum of 95% reliability at 90% confidence, using the success run equation, 45 test samples need to survive 850,000 cycles without failure.

Analysis is the verification of a product or system using models, calculations and testing equipment. Analysis allows someone to make predictive statements about the typical performance of a product or system based on the confirmed test results of a sample set or by combining the outcome of individual tests to conclude something new about the product or system.

Reliability testing is the cornerstone of a reliability engineering program. It provides the most detailed form of reliability data because the conditions under which the data are collected can be carefully controlled and monitored. Furthermore, reliability tests can be designed to uncover particular suspected failure modes and other problems.

Reliability Testing

•Reliability measures how consistent test results are over time from tests, surveys, observations, etc. •For educators, reliability refers to the extent to which assessment results are consistent in measuring student achievement.

For any system, one of the first tasks of reliability engineering is to adequately specify the reliability and maintainability requirements allocated from the overall availability needs and, more importantly, derived from proper design failure analysis or preliminary prototype test results. Clear requirements (able to designed to) should constrain the designers from designing particular unreliable items / constructions / interfaces / systems.

Reliability engineering - Wikipedia

Reliability testing can be used to determine the limits of a system, to examine systems for design flaws, and to demonstrate system reliability. The tests may be conducted according to industry standards or to required customer specifications.

Reliability can be assessed with the test-retest method, alternative form method, internal consistency method, the split-halves method, and inter-rater reliability. Test-retest is a method that administers the same instrument to the same sample at two different points in time, perhaps one year intervals.
