Immunization is now the most practical and reliable way to prevent yellow fever in people who live in and travel to areas where it is endemic. Still, control of mosquito populations is an essential component of any program designed to prevent the spread of yellow fever, particularly in urban areas.

appetite, and nausea
or vomiting. In most
cases, symptoms
disappear after 3 to 4
days.

Yellow fever - WHO

Yellow fever is a viral
disease of typically
short duration. In most
cases, symptoms
include fever, chills,
loss of appetite,
nausea, muscle pains
particularly in the back,
and headaches.

Symptoms typically

Yellow Fever

Most patients with this initial acute phase of the disease improve spontaneously after approximately three to four days. However, approximately 15% of patients may enter a second phase of the disease that typically appears after a short remission of symptoms (about 24 hours) from the initial phase of the illness.
