Sampling is one of the most important aspects of research design. In a research context, sampling refers to the process of selecting a subset of items from a defined population for inclusion into a study. We say items because the subset of things to include in your study may not always be people. Individuals are certainly the most common sampling unit in social and behavioral research, but sampling units can also be groups, events, places, and points in or periods of time.

Sampling, as it relates to research, refers to the selection of individuals, units, and/or settings to be studied. Whereas quantitative studies strive for random sampling, qualitative studies often use purposeful or criterion-based sampling, that is, a sample that has the characteristics relevant to the research question(s). Random sampling may be used for qualitative research, but typically is not necessary. Random sampling typically applies to quantitative research to test for statistical significance of the null hypotheses. Conversely, for qualitative, the goal is not statistical significance, but rather, data saturation. According to: Are We There Yet?
