Design/methodology/approach – The research analyzes the ability of vibration analysis and oil analysis on a screw compressor in an oil and gas plant. The vibration data and oil data were collected from commissioning thru failure. The data is presented to demonstrate each technology's ability to provide advance warning of the failure.

Effectiveness of Condition Monitoring on Screw Compressors

An advanced vibration and noise analysis is often required for larger or more critical systems. Design Requirements Dry screw compressors generally require specially designed silencers on the suction and discharge systems to attenuate pulsations, and wet screw compressors employ oil separators which can be acoustically or mechanically resonant.
