The Teledyne CAE J402 is a small turbojet engine. Several variants have been developed to power unmanned air vehicles such as missiles and target drones. Developed in the 1970s for the Harpoon anti-ship missile, the J402 was the first jet engine to be designed as a "wooden round", meaning that the engine had to be able to sit for long periods without maintenance or inspection and work right away.

The pioneer of these mini-engines is probably the American engineer Max DREHER, who in the 1960s built a series of small turbines for military or civil applications.. The French company JPX is probably the one that launched their use on a large scale (at a global level for model makers). Since then, competed by many other global companies, JPX has disappeared from this sector to refocus on ...

The General Electric J85 is a small single-shaft turbojet engine. Military versions produce up to 2,950 lbf of thrust dry; afterburning variants can reach up to 5,000 lbf. The engine, depending upon additional equipment and specific model, weighs from 300 to 500 pounds. It is one of GE's most successful and longest in service military jet engines, with the civilian versions having logged over 16.5 million hours of operation. The United States Air Force plans to continue using the J85 in aircraft

The turbojet is an airbreathing jet engine, typically used in aircraft. It consists of a gas turbine with a propelling nozzle. The gas turbine has an air inlet, a compressor, a combustion chamber, and a turbine (that drives the compressor). The compressed air from the compressor is heated by burning fuel in the combustion chamber and then allowed to expand through the turbine.

A small plate, or turbine flange is then made to bolt to the turbine housing. The turbine flange should have the same sized opening as the turbine inlet as well, plus four bolt holes to secure it to the turbo. The exhaust end cap and the turbine flange can be welded together by making a simple rectangular box section to go between the two.
