WHO | International perspectives on spinal cord injury

What is spinal cord injury (SCI)? The spinal cord is an extension of the brain and is made up of a thick bundle of nerves. The nerves carry messages from our brain to the rest of our body. These messages help us to move our body, feel pressure and control vital functions like breathing, blood pressure, bladder and bowels.

Understanding spinal cord injury (SCI) - a basic introduction

The spinal cord does not have to be severed in order for a loss of functioning to occur. In fact, in most people with spinal cord injury, the spinal cord is intact, but the damage due to compression or bruising to it results in loss of function. SCI is very different from back injuries such as ruptured disks, spinal stenosis or pinched nerves.
