Strapdown inertial navigation. The second problem in tracking and navigation is concerned with estimating the location and orientation of a body for which we have onboard kinematic measurements. Inertial measurement units (IMUs) consist of a set of three accelerometers placed to make acceleration-related measurements and a set of three rate gyroscopes that sense angular velocities in three mutually perpendicular directions.

Strapdown inertial navigation | Rotations

An inertial navigation system (INS) is a navigation device that uses a computer, motion sensors (accelerometers) and rotation sensors to continuously calculate by dead reckoning the position, the orientation, and the velocity (direction and speed of movement) of a moving object without the need for external references. Often the inertial sensors are supplemented by a barometric altimeter and ...
