Mounting evidence has been found for rapid evolution of invasive aliens and evolutionary responses of natives, but a mechanistic understanding requires tighter integration of molecular and phenotypic approaches. We hope the open questions identified in this review will stimulate further research on the ecology and evolution of alien plants.

Ecology and Evolution. The field of Ecology explores the interactive web of organisms and the environment. Studies in evolution consider the processes by which modern organisms have developed from ancestral ones. The Ecology and Evolution major is a good choice for students interested in the fundamental questions of the evolutionary origins of organisms and how they survive, or don't survive, in their changing habitats.

Ecology and Evolution is intentionally very broad. We accept descriptive studies. We accept work that is preliminary. We accept new opinions and ideas. Any research in ecology, evolution, or at the interface is acceptable. We do not distinguish between subfields of ecology or evolution - all are welcome.

Species distribution modeling is a widely used tool in many branches of ecology and evolution. However, evaluations of the transferability of species distribution models—their ability to predict the distribution of species in independent data domains—are rare.

Climate change is shifting the distribution of species, and may have a profound impact on the ecology and evolution of species interactions. However, we know little about the impact of increasing temperature and changing rainfall patterns on the interactions between plants and their beneficial and antagonistic root symbionts.

It is difficult to find references to fire in general textbooks on ecology, conservation biology or biogeography, in spite of the fact that large parts of the world burn on a regular basis, and that there is a considerable literature on the ecology of fire and its use for managing ecosystems.

The multi-agency Ecology and Evolution of Infectious Diseases program supports research on the ecological, evolutionary, and social drivers that influence the transmission dynamics of infectious diseases. The central theme of submitted projects must be the quantitative or computational understanding of pathogen transmission dynamics.

The Nature of Microbial Competition. Microbes dominate the tree of life in species number and diversity (see Glossary), and they inhabit the largest range of environments on earth. Like macroorganisms, microorganisms too live in a miniature entangled bank, where some species are tightly associated and rely heavily on each other to survive, such as the microbial guilds that convert nitrogen in ...
